

How to set up Docker?

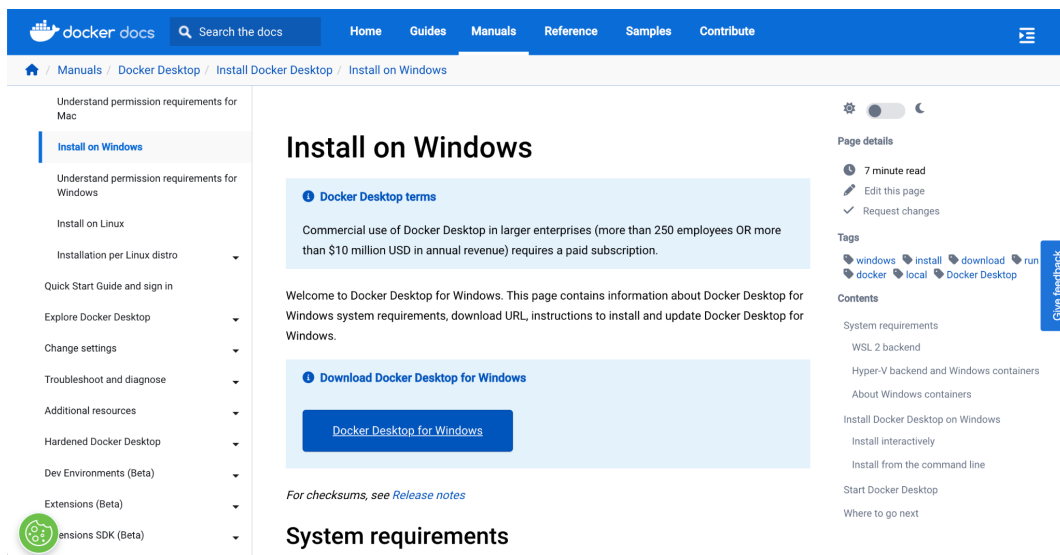

Table of Contents:

1. Installing Docker on Windows.
2. Installing Docker on macOS.

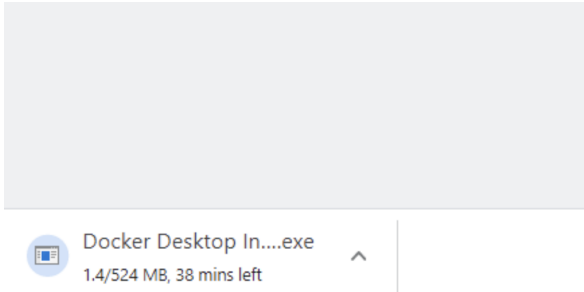

1. For Windows Users

Here are the step-by-step instructions on installing the docker on Windows 10.

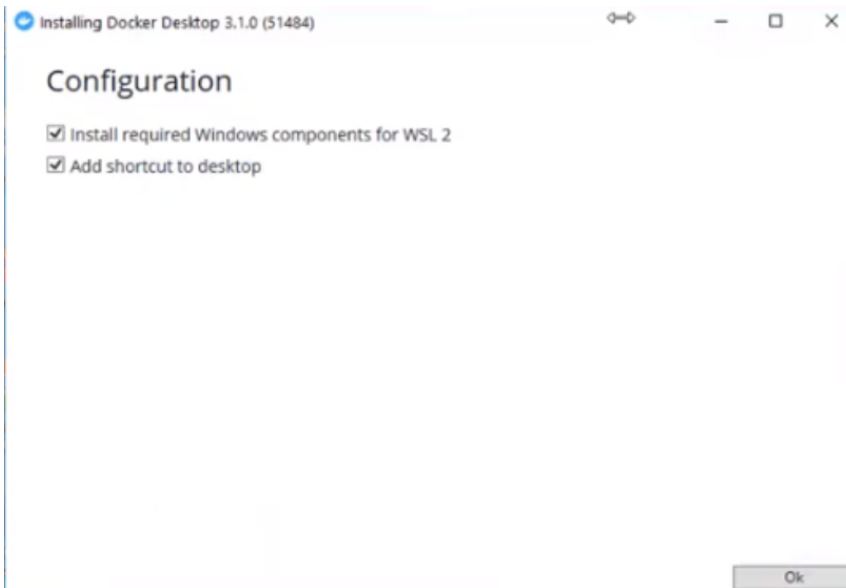

- 1) In the search bar, type Docker download. And click on the first link that appears or click on this link: [Docker link](#)
- 2) Click on the Docker Desktop for Windows.

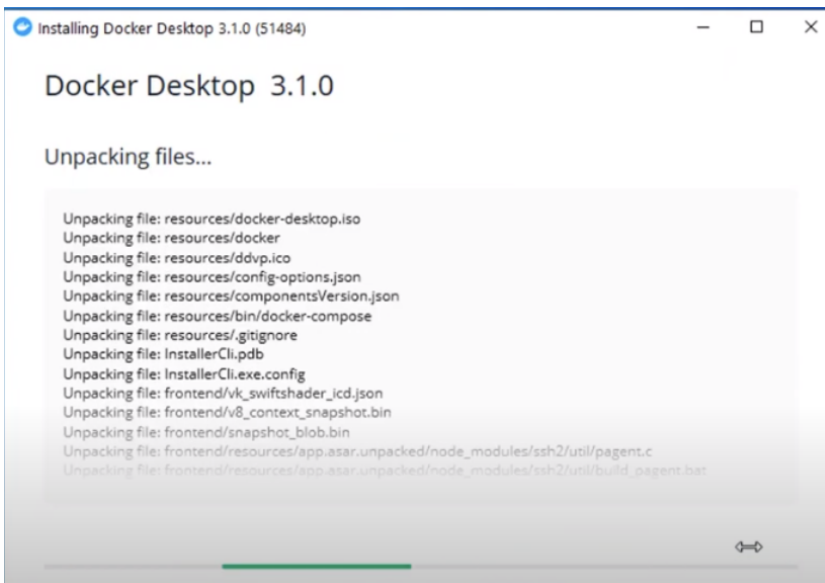

- 3) Once you click, the download will start, and the .exe file will be downloaded.

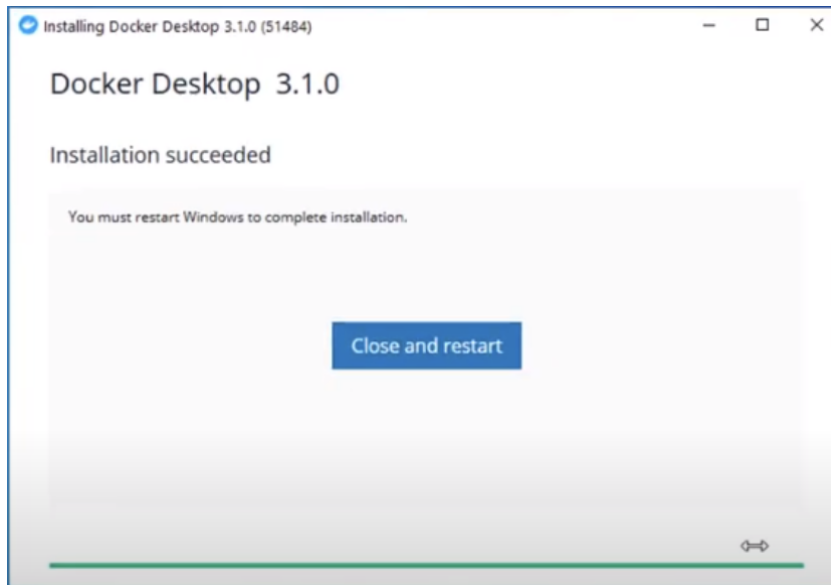

4) After installation, it will look something like this in Windows:

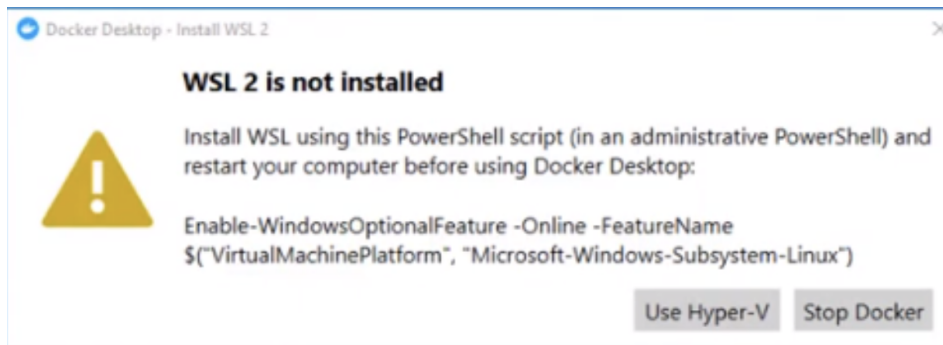

5) Select both options and click on Ok. After clicking Ok the installation will start.

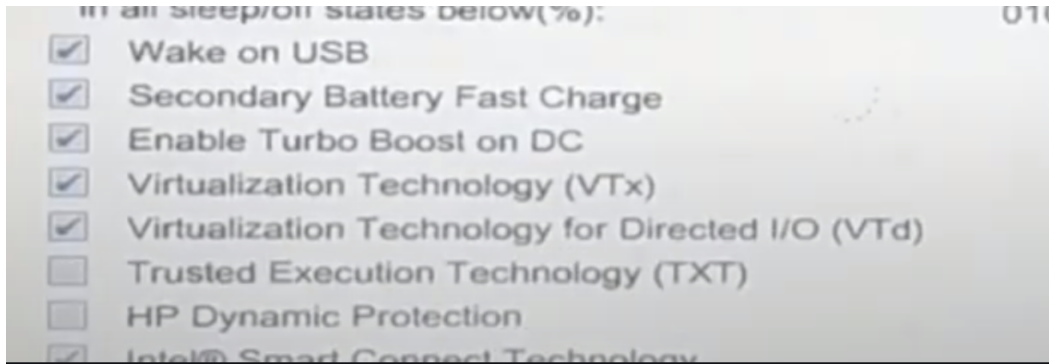

6) After installation, it will show something like the below:

- 7) After installation, you need to restart your PC and install WSL 2, which stands for Windows Setup for LINUX.
- 8) It is a compatibility layer for running Linux binary executables natively on Windows 10. After restarting, the following dialog box will appear, then click on the Stop Docker button there.

- 9) After clicking, we need to enable the Hyper-V, for that we will restart the PC and go to BIOS setup.
- 10) **Settings>Update and Security>Recovery>Advanced Setup>Device Configuration.** After that, if the option Enable Turbo Boost on DC. is unmarked, mark it, after it, save, and exit.

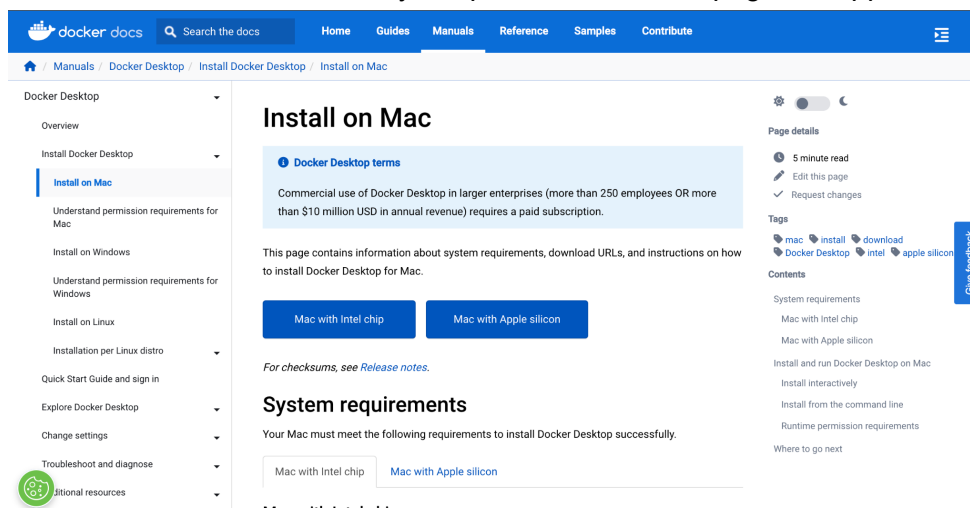

- 11) After then, in the last step, go to **Control Panel > Turn Windows Features on and off**. Then for activating **Hyper-V**, mark the **Hyper-V** and Windows **Hypervisor Platform**.
- 12) At this point, you have successfully installed and configured Docker on your Windows.
- 13) Open the command prompt and type docker to check whether the installation is successful or not.

2. For Macbook Users

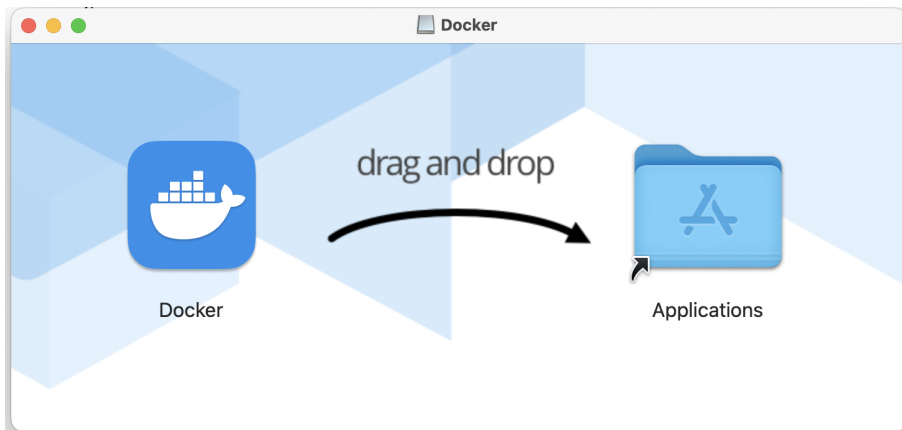

Here, is the step-by-step instructions on how to install it on Mac.

- 1) In the search bar, type Docker download. And click on the first link that appears or click on this link: [Docker link](#). Once you open the link below page will appear.

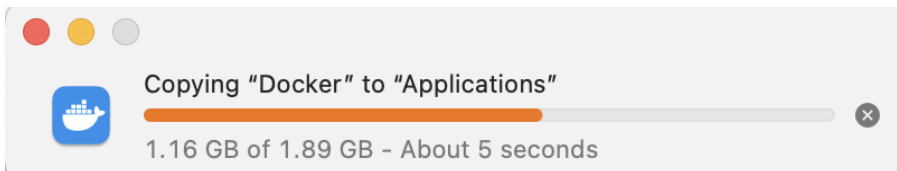

- 2) Before installing check whether your mac has an intel chip or Apple silicon. To check that Click on the apple icon on the top left corner > About this mac.
- 3) You can see the details of the chip based on it click on the appropriate one. Once you click the .dmg will be downloaded.

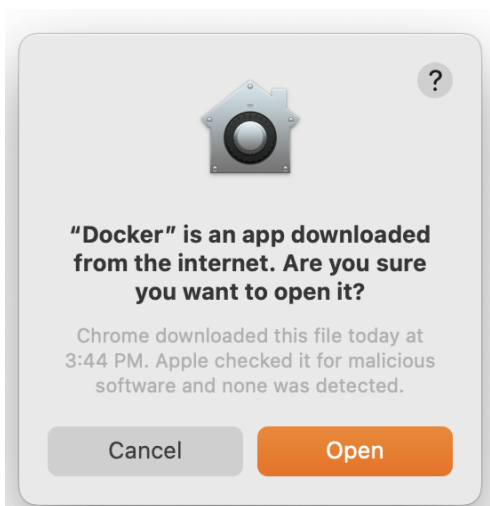

4) Once downloaded the below window will appear

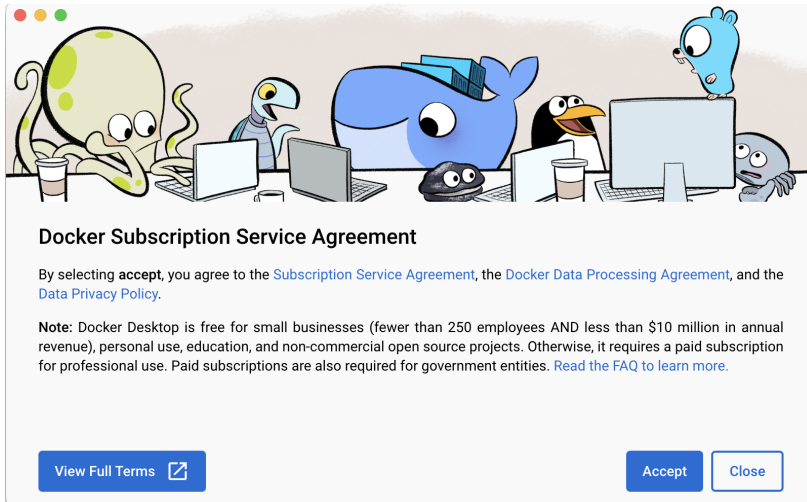

5) Drag and drop the Docker into applications and the below window will appear

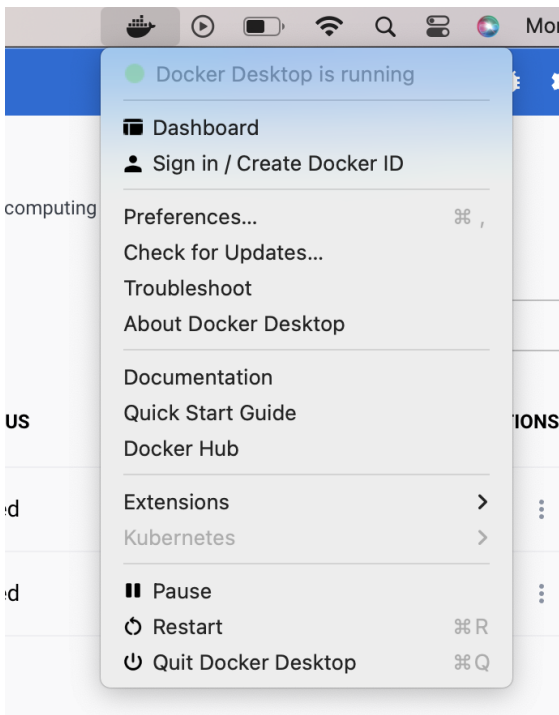

6) Once the docker is copied to the applications. Go to applications and search for Docker and click on it. Below window will appear

7) Click on open. Upon clicking the below window will appear

8) Click on Accept. Once done, you have successfully installed and configured Docker on your Windows.

9) You can see that the Docker Desktop is now running.
